dokuwiki, usb, apache, autoit

The concept is extremely simple : an USB stick, a MicroApache web server and a DokuWiki… Done !
You get a fully functional DokuWiki (only the plugins based on an external modules like an SQL or

authentication server will, at best, be more difficult to set up) ! 🥺

There's no need for a long installation guide :

- go to DokuWiki's standard download page, choose stable version, **check the magic [MicroApache] box** and whatever languages or plugins you are interested in
- download the package, uncompress it on your USB stick, launch the `run.bat` script
- go to the address `http://localhost:8800/install.php` for basic configuration

And voilà ! You have a beautyfull new wiki ready to roll at the following address :
`http://localhost:8800/doku.php`

It is possible to delete `install.php` file, but with an USB stick, there's little chance that anyone with

evil intention gets the oportunity to use it… 🤣

The biggest interest of this tool, in my humble opinion, is that since it functions exactly like any
DokuWiki, it is a wonderfull test environment tool perfect to develop plugins or templates.

Any drawback ? A very small one… A batch script to launch and "manage" Micro Apache is an ugly

thing 🤐
This is why I made this AutoIt script.

For posterity, here is the page of the initial project but the version you can download there is, by far,
totally obsolete.
